$V_{CE(SAT)}$  - Saturation voltage of the output switch.

$V_F$  - Forward voltage drop of the ringback rectifier.

**The following power supply characteristics must be chosen:**

$V_{IN}$  - Nominal input voltage.

$V_{OUT}$  - Desired output voltage,  $|V_{OUT}| = 1.25(1+R_2/R_1)$

$I_{OUT}$  - Desired output current.

$F_{MIN}$  - Minimum desired output switching frequency at the selected values for  $V_{IN}$  and  $I_{OUT}$ .

$V_{RIPPLE(P-P)}$  - Desired peak-to-peak output ripple voltage. In practice, the calculated value will need to be increased due to the capacitor equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly effect the line and load regulation.
