## Descriptions

The DIO3157E is an enhanced single-pole double-throw (SPDT) CMOS analog switch. It features power ON/OFF protection on common ports effectively protecting device against external signal perturbation. It also offers excellent -3db bandwidth and lower ON resistance, which can be used as analog switch in multiple applications.

DIO3157E operates under wide  $V_{cc}$  supply from 1.65V to 5.5V, consuming very low quiescent current even when the voltage of S pin is lower than  $V_{cc}$  supply. This new feature services the mobile handset applications very well allowing for the direct interface with baseband processor general purpose I/Os with no need of level translator.
