

GENERAL DESCRIPTION

SE87XX series is designed for power-sensitive applications. It includes a precision and high voltage input stage, an ultra-low-power bias current branch, and results in a ultra-low-power and low-dropout linear regulator.

The SE87XX operates from an input voltage of $V_{OUT}+1V$ to 40V, consumes only $2.6\mu A$ of quiescent current, and offers 1% initial accuracy and SoftStart function. At power startup, the output voltage overshoot is less than 100mV.

The SE87XX regulators is available in standard SOT89-3L, and SOT23-3L packages. Standard products are Pb-free and Halogen-free.

APPLICATION INFORMATION

INPUT CAPACITOR

An input capacitor of $10\mu F$ is required between the VIN and GND pin. The capacitor shall be placed as close as possible to VIN pin, and the use of electrolytic capacitors is recommended.

OUTPUT CAPACITOR

The recommended is $10\mu F$ MLCC capacitor. The minimum capacitance for stable and correct operation is $1\mu F$.

NO-LOAD STABILITY

The SE87XX will remain stable and in regulation with no external load. This is especially important in CMOS RAM keep-alive applications.

TYPICAL CIRCUIT

The following figure shows a typical application circuit for the SE87XX devices. Please keep in mind that in-rush current can push up the Vin overshoot by as much as 50%. For example, when $Vin=30V$, the in-rush caused spike voltage can be as high as $45V$. Therefore the voltage rating of C_{in} needs to be higher than 50% of the application.

In live insertion application, it is suggested that R, C1 are selected as following:

1. $C1=10\mu F \sim 100\mu F$ electrolytic capacitor with maximum voltage greater than $50V$, $R=0$
2. $C1=1\mu F \sim 10\mu F$ MLCC with maximum voltage greater than $50V$ and $R=2\Omega$ in the type of 1206
